```
public interface Closeable
extends AutoCloseable
```

A `Closeable` is a source or destination of data that can be closed. The close method is invoked to release resources that the object is holding (such as open files).

Since:

1.5

Method Summary

		Abstract Methods
Modifier and Type	**Method**	**Description**
void	**close**()	Closes this stream and releases any system resources associated with it.

Method Detail

close

```
void close()
    throws IOException
```

Closes this stream and releases any system resources associated with it. If the stream is already closed then invoking this method has no effect.

As noted in `AutoCloseable.close()`, cases where the close may fail require careful attention. It is strongly advised to relinquish the underlying resources and to internally *mark* the `Closeable` as closed, prior to throwing the `IOException`.

Specified by:

close in interface AutoCloseable

Throws:

IOException - if an I/O error occurs
