Enum Class Character.UnicodeScript

java.lang.Object
  java.lang.Enum<Character.UnicodeScript>
    java.lang.Character.UnicodeScript

All Implemented Interfaces:

Serializable, Comparable<Character.UnicodeScript>, Constable

Enclosing class:

Character

```
public static enum Character.UnicodeScript
extends Enum<Character.UnicodeScript>
```

A family of character subsets representing the character scripts defined in the *Unicode Standard Annex #24: Script Names*. Every Unicode character is assigned to a single Unicode script, either a specific script, such as Latin, or one of the following three special values, Inherited, Common or Unknown.

Method Details

values

```
public static Character.UnicodeScript[] values()
```

Returns an array containing the constants of this enum class, in the order they are declared.

Returns:

an array containing the constants of this enum class, in the order they are declared

valueOf

```
public static Character.UnicodeScript valueOf(String name)
```

Returns the enum constant of this class with the specified name. The string must match *exactly* an identifier used to declare an enum constant in this class. (Extraneous whitespace characters are not permitted.)

Parameters:

`name` - the name of the enum constant to be returned.

Returns:

the enum constant with the specified name

Throws:

`IllegalArgumentException` - if this enum class has no constant with the specified name

`NullPointerException` - if the argument is null

of

```
public static Character.UnicodeScript of(int codePoint)
```

Returns the enum constant representing the Unicode script of which the given character (Unicode code point) is assigned to.

Parameters:

`codePoint` - the character (Unicode code point) in question.

Returns:

The `UnicodeScript` constant representing the Unicode script of which this character is assigned to.

Throws:

`IllegalArgumentException` - if the specified `codePoint` is an invalid Unicode code point.

`Character.isValidCodePoint(int)`

forName

```
public static final Character.UnicodeScript forName
(String scriptName)
```

Returns the UnicodeScript constant with the given Unicode script name or the script name alias. Script names and their aliases are determined by The Unicode Standard. The files `Scripts.txt` and `PropertyValueAliases.txt` define script names and the script name aliases for a particular version of the standard. The `Character` class specifies the version of the standard that it supports.

Character case is ignored for all of the valid script names. The en_US locale's case mapping rules are used to provide case-insensitive string comparisons for script name validation.

Parameters:

`scriptName` - A `UnicodeScript` name.

Returns:

The `UnicodeScript` constant identified by `scriptName`

Throws:

`IllegalArgumentException` - if `scriptName` is an invalid name

`NullPointerException` - if `scriptName` is null
