Java SE 27 & JDK 27

Interface MemoryManagerMXBean

All Superinterfaces:

PlatformManagedObject

All Known Subinterfaces:

GarbageCollectorMXBean, GarbageCollectorMXBean

```
public interface MemoryManagerMXBean
extends PlatformManagedObject
```

The management interface for a memory manager. A memory manager manages one or more memory pools of the Java virtual machine.

A Java virtual machine has one or more memory managers. An instance implementing this interface is an MXBean that can be obtained by calling the ManagementFactory.getMemoryManagerMXBeans() method or from the platform MBeanServer method.

The ObjectName for uniquely identifying the MXBean for a memory manager within an MBeanServer is:

> java.lang:type=MemoryManager,name=*manager's name*

It can be obtained by calling the PlatformManagedObject.getObjectName() method.

Since:

1.5

Method Summary

All Methods	Instance Methods	

Modifier and Type	Method	Description
String[]	**getMemoryPoolNames**()	Returns the name of memory pools that this memory manager manages.
String	**getName**()	

		Returns the name representing this memory manager.
boolean	**isValid**()	Tests if this memory manager is valid in the Java virtual machine.

Methods declared in interface PlatformManagedObject

getObjectName

Method Details

getName

String getName()

Returns the name representing this memory manager.

Returns:

the name of this memory manager.

isValid

boolean isValid()

Tests if this memory manager is valid in the Java virtual machine. A memory manager becomes invalid once the Java virtual machine removes it from the memory system.

Returns:

`true` if the memory manager is valid in the Java virtual machine; `false` otherwise.

getMemoryPoolNames

String[] getMemoryPoolNames()

Returns the name of memory pools that this memory manager manages.

Returns:

an array of `String` objects, each is the name of a memory pool that this memory manager manages.
