Java SE 27 & JDK 27

Interface AnnotatedParameterizedType

All Superinterfaces:

AnnotatedElement, AnnotatedType

---

public interface **AnnotatedParameterizedType**
extends AnnotatedType

AnnotatedParameterizedType represents the potentially annotated use of a parameterized type, whose type arguments may themselves represent annotated uses of types.

See *Java Language Specification*:

4.5 Parameterized Types

Since:

1.8

Method Summary

All Methods	Instance Methods	

Modifier and Type	Method	Description
AnnotatedType[]	**getAnnotatedActualTypeAr**	Returns the potentially annotated actual type arguments of this parameterized type.
AnnotatedType	**getAnnotatedOwnerType**()	Returns the potentially annotated type that this type is a member of, if this type represents a nested type.

Methods declared in interface AnnotatedElement

getAnnotationsByType, getDeclaredAnnotation, getDeclaredAnnotationsByType, isAnnotationPresent

Methods declared in interface AnnotatedType

`getAnnotation`, `getAnnotations`, `getDeclaredAnnotations`, `getType`

Method Details

getAnnotatedActualTypeArguments

`AnnotatedType[] getAnnotatedActualTypeArguments()`

Returns the potentially annotated actual type arguments of this parameterized type.

Note that in some cases, the returned array can be empty. This can occur if this annotated type represents a non-parameterized type nested within a parameterized type.

Returns:

the potentially annotated actual type arguments of this parameterized type

See Also:

`ParameterizedType.getActualTypeArguments()`

getAnnotatedOwnerType

`AnnotatedType getAnnotatedOwnerType()`

Returns the potentially annotated type that this type is a member of, if this type represents a nested type. For example, if this type is `@TA O<T>.I<S>`, return a representation of `@TA O<T>`.

Returns `null` if this `AnnotatedType` represents a top-level class or interface, or a local or anonymous class, or a primitive type, or void.

Specified by:

`getAnnotatedOwnerType` in interface `AnnotatedType`

Returns:

an `AnnotatedType` object representing the potentially annotated type that this type is a member of, or `null`

Throws:

`TypeNotPresentException` - if the owner type refers to a non-existent class or interface declaration

`MalformedParameterizedTypeException` - if the owner type refers to a parameterized type that cannot be instantiated for any reason

Since:

9
