Java SE 27 & JDK 27

Class MalformedParametersException

java.lang.Object
  java.lang.Throwable
    java.lang.Exception
      java.lang.RuntimeException
        java.lang.reflect.MalformedParametersException

All Implemented Interfaces:

`Serializable`

```
public class MalformedParametersException
extends RuntimeException
```

Thrown when `the java.lang.reflect package` attempts to read method parameters from a class file and determines that one or more parameters are malformed.

The following is a list of conditions under which this exception can be thrown:

- The number of parameters (parameter_count) is wrong for the method
- A constant pool index is out of bounds.
- A constant pool index does not refer to a UTF-8 entry
- A parameter's name is "", or contains an illegal character
- The flags field contains an illegal flag (something other than FINAL, SYNTHETIC, or MANDATED)

See `Executable.getParameters()` for more information.

Since:

1.8
