Java SE 27 & JDK 27

Class FileTypeDetector

java.lang.Object
    java.nio.file.spi.FileTypeDetector

```
public abstract class FileTypeDetector
extends Object
```

A file type detector for probing a file to guess its file type.

A file type detector is a concrete implementation of this class, has a zero-argument constructor, and implements the abstract methods specified below.

The means by which a file type detector determines the file type is highly implementation specific. A simple implementation might examine the *file extension* (a convention used in some platforms) and map it to a file type. In other cases, the file type may be stored as a file attribute or the bytes in a file may be examined to guess its file type.

Since:

1.7

Constructor Summary

Constructors

Modifier	Constructor	Description
protected	`FileTypeDetector()`	Initializes a new instance of this class.

Method Summary

All Methods | **Instance Methods**

Modifier and Type	Method	Description
abstract String	`probeContentType(Path path)`	Probes the given file to guess its content type.

Methods declared in class Object

`clone`, `equals`, `finalize`, `getClass`, `hashCode`, `notify`, `notifyAll`, `toString`, `wait`, `wait`, `wait`

Constructor Details

FileTypeDetector

```
protected FileTypeDetector()
```

Initializes a new instance of this class.

Method Details

probeContentType

```
public abstract String probeContentType(Path path)
                                 throws IOException
```

Probes the given file to guess its content type.

The means by which this method determines the file type is highly implementation
specific. It may simply examine the file name, it may use a file attribute, or it may examine bytes in the file.

The probe result is the string form of the value of a Multipurpose Internet Mail Extension (MIME) content type as defined by *RFC 2045: Multipurpose Internet Mail Extensions (MIME) Part One: Format of Internet Message Bodies*. The string must be parsable according to the grammar in the RFC 2045.

Parameters:

`path` - the path to the file to probe

Returns:

The content type or `null` if the file type is not recognized

Throws:

`IOException` - An I/O error occurs

External Specifications

RFC 2045: Multipurpose Internet Mail Extensions (MIME) Part One: Format of Internet Message Bodies
