Class DateFormatProvider

java.lang.Object
    java.util.spi.LocaleServiceProvider
        java.text.spi.DateFormatProvider

```
public abstract class DateFormatProvider
extends LocaleServiceProvider
```

An abstract class for service providers that provide concrete implementations of the `DateFormat` class.

Since:

1.6

Constructor Summary

Constructors

Modifier	Constructor	Description
protected	**DateFormatProvider**()	Sole constructor.

Method Summary

All Methods | **Instance Methods**

Modifier and Type	Method	Description
abstract DateFormat	**getDateInstance**(int style, Locale locale)	Returns a new DateFormat instance which formats date with the given formatting style for the specified locale.
abstract DateFormat	**getDateTimeInstance**(int dateStyle, int timeStyle, Locale locale)	Returns a new DateFormat instance which formats date and time with the given formatting style for the specified locale.
abstract DateFormat	**getTimeInstance**(int style, Locale locale)	Returns a new DateFormat instance which formats time with the given formatting

style for the specified locale.

Methods declared in class LocaleServiceProvider

`getAvailableLocales`, `isSupportedLocale`

Methods declared in class Object

`clone`, `equals`, `finalize`, `getClass`, `hashCode`, `notify`, `notifyAll`, `toString`, `wait`, `wait`, `wait`

Constructor Details

DateFormatProvider

```
protected DateFormatProvider()
```

Sole constructor. (For invocation by subclass constructors, typically implicit.)

Method Details

getTimeInstance

```
public abstract DateFormat getTimeInstance(int style,
                                           Locale locale)
```

Returns a new `DateFormat` instance which formats time with the given formatting style for the specified locale.

Parameters:

`style` - the given formatting style. Either one of `DateFormat.SHORT`, `DateFormat.MEDIUM`, `DateFormat.LONG`, or `DateFormat.FULL`.

`locale` - the desired locale.

Returns:

a time formatter.

Throws:

`IllegalArgumentException` - if `style` is invalid, or if `locale` isn't one of the locales returned from `getAvailableLocales()`.

NullPointerException - if locale is null

See Also:

DateFormat.getTimeInstance(int, java.util.Locale)

getDateInstance

```
public abstract DateFormat getDateInstance(int style,
                                           Locale locale)
```

Returns a new DateFormat instance which formats date with the given formatting style for the specified locale.

Parameters:

style - the given formatting style. Either one of DateFormat.SHORT, DateFormat.MEDIUM, DateFormat.LONG, or DateFormat.FULL.

locale - the desired locale.

Returns:

a date formatter.

Throws:

IllegalArgumentException - if style is invalid, or if locale isn't one of the locales returned from getAvailableLocales().

NullPointerException - if locale is null

See Also:

DateFormat.getDateInstance(int, java.util.Locale)

getDateTimeInstance

```
public abstract DateFormat getDateTimeInstance(int dateStyle,
                                               int timeStyle,
                                               Locale locale)
```

Returns a new DateFormat instance which formats date and time with the given formatting style for the specified locale.

Parameters:

dateStyle - the given date formatting style. Either one of DateFormat.SHORT, DateFormat.MEDIUM, DateFormat.LONG, or DateFormat.FULL.

timeStyle - the given time formatting style. Either one of DateFormat.SHORT, DateFormat.MEDIUM, DateFormat.LONG, or DateFormat.FULL.

locale - the desired locale.

Returns:

a date/time formatter.

Throws:

`IllegalArgumentException` - if `dateStyle` or `timeStyle` is invalid, or if `locale` isn't one of the locales returned from `getAvailableLocales()`.

`NullPointerException` - if `locale` is null
