Java SE 27 & JDK 27

Class TooManyListenersException

java.lang.Object
    java.lang.Throwable
        java.lang.Exception
            java.util.TooManyListenersException

All Implemented Interfaces:

Serializable

```
public class TooManyListenersException
extends Exception
```

The `TooManyListenersException` Exception is used as part of the Java Event model to annotate and implement a unicast special case of a multicast Event Source.

The presence of a "throws TooManyListenersException" clause on any given concrete implementation of the normally multicast "void addXyzEventListener" event listener registration pattern is used to annotate that interface as implementing a unicast Listener special case, that is, that one and only one Listener may be registered on the particular event listener source concurrently.

Since:

1.1

Constructor Summary

Constructors

Constructor	Description
`TooManyListenersException``()`	Constructs a TooManyListenersException with no detail message.
`TooManyListenersException``(String s)`	Constructs a TooManyListenersException with the specified detail message.

Method Summary

Methods declared in class Throwable

addSuppressed, fillInStackTrace, getCause, getLocalizedMessage, getMessage, getStackTrace, getSuppressed, initCause, printStackTrace, printStackTrace, printStackTrace, setStackTrace, toString

Methods declared in class Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, wait, wait, wait

Constructor Details

TooManyListenersException

```
public TooManyListenersException()
```

Constructs a TooManyListenersException with no detail message. A detail message is a String that describes this particular exception.

TooManyListenersException

```
public TooManyListenersException(String s)
```

Constructs a TooManyListenersException with the specified detail message. A detail message is a String that describes this particular exception.

Parameters:

s - the detail message
