# Interface LongConsumer

**All Known Subinterfaces:**

`LongStream.Builder`

**All Known Implementing Classes:**

`LongSummaryStatistics`

**Functional Interface:**

This is a functional interface and can therefore be used as the assignment target for a lambda expression or method reference.

---

```
@FunctionalInterface
public interface LongConsumer
```

Represents an operation that accepts a single `long`-valued argument and returns no result. This is the primitive type specialization of `Consumer` for `long`. Unlike most other functional interfaces, `LongConsumer` is expected to operate via side-effects.

This is a functional interface whose functional method is `accept(long)`.

**Since:**

1.8

**See Also:**

`Consumer`

## *Method Summary*

| Modifier and Type | Method | Description |
| --- | --- | --- |
| `void` | **`accept`**`(long value)` | Performs this operation on the given argument. |
| `default LongConsumer` | **`andThen`**`(LongConsumer after)` | Returns a composed `LongConsumer` that performs, in sequence, this operation followed by the `after` operation. |

## *Method Details*

### accept

`void accept(long value)`

Performs this operation on the given argument.

**Parameters:**

`value` - the input argument

### andThen

`default LongConsumer andThen(LongConsumer after)`

Returns a composed `LongConsumer` that performs, in sequence, this operation followed by the `after` operation. If performing either operation throws an exception, it is relayed to the caller of the composed operation. If performing this operation throws an exception, the `after` operation will not be performed.

**Parameters:**

`after` - the operation to perform after this operation

**Returns:**

a composed `LongConsumer` that performs in sequence this operation followed by the `after` operation

**Throws:**

`NullPointerException` - if `after` is null
