Java SE 27 & JDK 27

Interface ObjIntConsumer<T>

Type Parameters:

T - the type of the object argument to the operation

Functional Interface:

This is a functional interface and can therefore be used as the assignment target for a lambda expression or method reference.

```
@FunctionalInterface
public interface ObjIntConsumer<T>
```

Represents an operation that accepts an object-valued and a `int`-valued argument, and returns no result. This is the `(reference, int)` specialization of `BiConsumer`. Unlike most other functional interfaces, `ObjIntConsumer` is expected to operate via side-effects.

This is a functional interface whose functional method is `accept(Object, int)`.

Since:

1.8

`BiConsumer`

Method Summary

All Methods	Instance Methods	

Modifier and Type	Method	Description
`void`	`accept(T t, int value)`	Performs this operation on the given arguments.

Method Details

accept

```
void accept(T t,
            int value)
```

Performs this operation on the given arguments.

Parameters:

`t` - the first input argument

`value` - the second input argument
