Java SE 27 & JDK 27

Interface Stream.Builder<T>

Type Parameters:

T - the type of stream elements

All Superinterfaces:

Consumer<T>

Enclosing interface:

Stream<T>

```
public static interface Stream.Builder<T>
extends Consumer<T>
```

A mutable builder for a `Stream`. This allows the creation of a `Stream` by generating elements individually and adding them to the `Builder` (without the copying overhead that comes from using an `ArrayList` as a temporary buffer.)

A stream builder has a lifecycle, which starts in a building phase, during which elements can be added, and then transitions to a built phase, after which elements may not be added. The built phase begins when the `build()` method is called, which creates an ordered `Stream` whose elements are the elements that were added to the stream builder, in the order they were added.

Since:

1.8

See Also:

`Stream.builder()`

Method Summary

All Methods	Instance Methods	

Modifier and Type	Method	Description
void	**accept**(T t)	Adds an element to the stream being built.
default Stream.Builder<T>	**add**(T t)	Adds an element to the stream being built.
Stream<T>	**build**()	Builds the stream, transitioning this builder to the built state.

Methods declared in interface Consumer

andThen

Method Details

accept

`void accept(T t)`

Adds an element to the stream being built.

Specified by:

accept in interface Consumer<T>

Parameters:

t - the input argument

Throws:

IllegalStateException - if the builder has already transitioned to the built state

add

`default Stream.Builder<T> add(T t)`

Adds an element to the stream being built.

Implementation Requirements:

The default implementation behaves as if:

```
    accept(t)
    return this;
```

Parameters:

t - the element to add

Returns:

this builder

Throws:

IllegalStateException - if the builder has already transitioned to the built state

build

`Stream<T> build()`

Builds the stream, transitioning this builder to the built state. An `IllegalStateException` is thrown if there are further attempts to operate on the builder after it has entered the built state.

Returns:

the built stream

Throws:

`IllegalStateException` - if the builder has already transitioned to the built state
