java.time.zone

Enum ZoneOffsetTransitionRule.TimeDefinition

java.lang.Object
    java.lang.Enum<ZoneOffsetTransitionRule.TimeDefinition>
        java.time.zone.ZoneOffsetTransitionRule.TimeDefinition

All Implemented Interfaces:

Serializable, Comparable<ZoneOffsetTransitionRule.TimeDefinition>

Enclosing class:

ZoneOffsetTransitionRule

```
public static enum ZoneOffsetTransitionRule.TimeDefinition
extends Enum<ZoneOffsetTransitionRule.TimeDefinition>
```

A definition of the way a local time can be converted to the actual transition date-time.

Time zone rules are expressed in one of three ways:

- Relative to UTC
- Relative to the standard offset in force
- Relative to the wall offset (what you would see on a clock on the wall)

Enum Constant Summary

Enum Constants

Enum Constant	Description
STANDARD	The local date-time is expressed in terms of the standard offset.
UTC	The local date-time is expressed in terms of the UTC offset.

WALL	The local date-time is expressed in terms of the wall offset.

Method Summary

Concrete Methods

Modifier and Type	Method
LocalDateTime	**createDateTime**(**LocalDateTime** da **ZoneOffset** standardOffset, **ZoneOffset** wallOffset)
static **ZoneOffsetTransitionRule.TimeDefinition**	**valueOf**(**String** name)
static **ZoneOffsetTransitionRule.TimeDefinition**[]	**values**()

Methods inherited from class java.lang.Enum

clone, compareTo, equals, finalize, getDeclaringClass, hashCode, name, ordinal, toString, valueOf

Methods inherited from class java.lang.Object

getClass, notify, notifyAll, wait, wait, wait

Enum Constant Detail

UTC

```
public static final ZoneOffsetTransitionRule.TimeDefinition UTC
```

The local date-time is expressed in terms of the UTC offset.

WALL

```
public static final ZoneOffsetTransitionRule.TimeDefinition WALL
```

The local date-time is expressed in terms of the wall offset.

STANDARD

```
public static final ZoneOffsetTransitionRule.TimeDefinition STANDARD
```

The local date-time is expressed in terms of the standard offset.

Method Detail

values

```
public static ZoneOffsetTransitionRule.TimeDefinition[] values()
```

Returns an array containing the constants of this enum type, in the order they are declared. This method may be used to iterate over the constants as follows:

```
for (ZoneOffsetTransitionRule.TimeDefinition c : ZoneOffsetTransitionRule.TimeDef
    System.out.println(c);
```

Returns:

an array containing the constants of this enum type, in the order they are declared

valueOf

```
public static ZoneOffsetTransitionRule.TimeDefinition valueOf(String name)
```

Returns the enum constant of this type with the specified name. The string must match *exactly* an identifier used to declare an enum constant in this type. (Extraneous whitespace characters are not permitted.)

Parameters:

`name - the name of the enum constant to be returned.`

Returns:

`the enum constant with the specified name`

Throws:

`IllegalArgumentException - if this enum type has no constant with the specified name`

`NullPointerException - if the argument is null`

createDateTime

```
public LocalDateTime createDateTime(LocalDateTime dateTime,
                                    ZoneOffset standardOffset,
                                    ZoneOffset wallOffset)
```

Converts the specified local date-time to the local date-time actually seen on a wall clock.

This method converts using the type of this enum. The output is defined relative to the 'before' offset of the transition.

The UTC type uses the UTC offset. The STANDARD type uses the standard offset. The WALL type returns the input date-time. The result is intended for use with the wall-offset.

Parameters:

`dateTime - the local date-time, not null`

`standardOffset - the standard offset, not null`

`wallOffset - the wall offset, not null`

Returns:

C
```
the date-time relative to the wall/before offset, not null
```
