java.util.function

Interface ObjIntConsumer<T>

Type Parameters:

`T - the type of the object argument to the operation`

Functional Interface:

`This is a functional interface and can therefore be used as the assignment target for a lambda expression or method reference.`

```
@FunctionalInterface
public interface ObjIntConsumer<T>
```

Represents an operation that accepts an object-valued and a `int`-valued argument, and returns no result. This is the `(reference, int)` specialization of `BiConsumer`. Unlike most other functional interfaces, `ObjIntConsumer` is expected to operate via side-effects.

This is a functional interface whose functional method is `accept(Object, int)`.

Since:

1.8

`BiConsumer`

Method Summary

		Abstract Methods
Modifier and Type	**Method**	**Description**

void	**accept**(T t, int value)	Performs this operation on the given arguments.

Method Detail

accept

```
void accept(T t,
            int value)
```

Performs this operation on the given arguments.

Parameters:

`t - the first input argument`

`value - the second input argument`
