java.util.logging

Class LoggingPermission

java.lang.Object
  java.security.Permission
    java.security.BasicPermission
      java.util.logging.LoggingPermission

All Implemented Interfaces:

Serializable, Guard

```
public final class LoggingPermission
extends BasicPermission
```

The permission which the SecurityManager will check when code that is running with a SecurityManager calls one of the logging control methods (such as Logger.setLevel).

Currently there is only one named LoggingPermission. This is "control" and it grants the ability to control the logging configuration, for example by adding or removing Handlers, by adding or removing Filters, or by changing logging levels.

Programmers do not normally create LoggingPermission objects directly. Instead they are created by the security policy code based on reading the security policy file.

Since:

1.4

Constructor Summary

Constructors	Description
`LoggingPermission(String name, String actions)`	Creates a new LoggingPermission object.

Method Summary

Methods inherited from class java.security.BasicPermission

`equals`, `getActions`, `hashCode`, `implies`, `newPermissionCollection`

Methods inherited from class java.security.Permission

`checkGuard`, `getName`, `toString`

Methods inherited from class java.lang.Object

`clone`, `finalize`, `getClass`, `notify`, `notifyAll`, `wait`, `wait`, `wait`

Constructor Detail

LoggingPermission

```
public LoggingPermission(String name,
                         String actions)
                  throws IllegalArgumentException
```

Creates a new LoggingPermission object.

Parameters:

`name` - Permission name. Must be "control".

`actions` - Must be either null or the empty string.

Throws:

`NullPointerException` - if name is null.

C

`IllegalArgumentException` - if name is empty or if arguments are invalid.
